3. Federal Public Debt - FPD Maturity Profile

3.1 Maturities

FPD maturities in the next 12 months posted a decrease, shifting from 18.11% in October to 17.91% in November.

The volume of DFPD securities maturing in up to 12 months shifted from 18.13% in October to 17.92% in November. Fixed-rate securities accounted for 46.96% of this total, followed by floating-rate securities with share of 32.91% of the total.

With respect to EFPD, the percentage maturing in 12 months increased from 17.60% in October to 17.61% in November, with those denominated in American Dollar accounting for 94.95% of this total. It is important to emphasize maturities over five years account for 50.79% of outstanding EFPD.

3.3 Average Term to Maturity

The National Treasury releases the data of average life using new methodology called Average Term to Maturity – ATM, which is most commonly found in the international literature and therefore allows greater comparability between Brazil and other countries as refers to the maturity of government debt.

The new methodology for the average life is calculated by averaging weighted remaining time to maturity of each security that make up the FPD, considering principal only. The weighting occurs by value of each security, using their face value.

FPD average life, in this new methodology, decreased from 5.53 years, in October, to 5.47 years, in November.

4.2 Average Cost of DFPD - Public Offerings

The average cost of DFPD issuances in public offerings is an indicator that reflects the internal rate of return - IRR of Treasury securities in domestic market, plus the variations of their indexes, considering only the placement of securities in a public offering (auctions) in the last 12 months. From January 2021 on, this indicator is calculated using a new methodology.

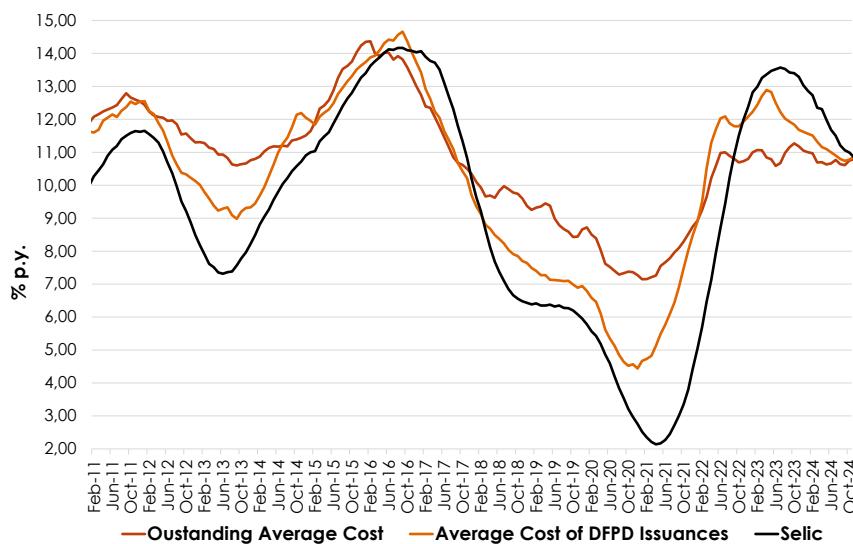

In the month of November, the average cost of DFPD issuances in public offerings moved from 10.78% per year in October to 10.86% per year in November.

5.2 Public Securities Yield

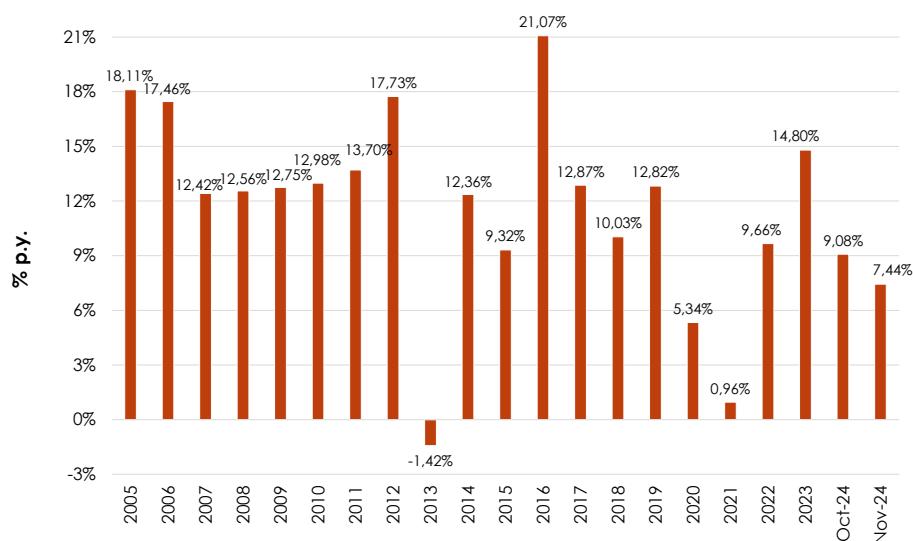

The Anbima Market index - IMA³, created by ANBIMA⁴ in a partnership with the National Treasury, verifies the profitability of a theoretical portfolio composed of public securities in circulation on the market. It is considered an efficient parameter for purposes of evaluating the evolution of public security profitability, and has introduced greater dynamics into the primary and secondary federal public debt markets.

Data for the month of November indicate a decrease of 1.64 percentage point in the General Index from October to November. Fixed rate securities, represented by IRF-M decreased 3.16 percentage point. The securities linked to the IPCA, represented by the IMA – B, decreased 2.68 percentage point. Finally, the IMA-S index, referring to SELIC-linked securities, in its turn, decreased 0.09 percentage point.

6. Public Debt Liquidity Reserve

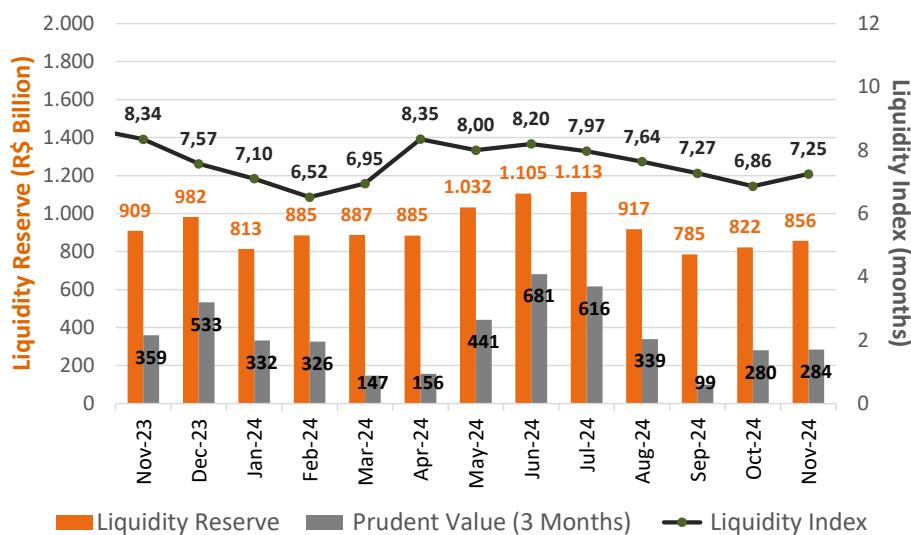

Public debt liquidity reserve (or debt cushion) comprises cash availabilities that are earmarked for domestic debt payment and the cash balance from government bonds issuances proceeds. Debt liquidity reserve comprises a subset of cash availability within the National Treasury Single Account (CTU) at the Central Bank.

The liquidity reserve position registered a 4.09% nominal increase, shifting from R\$ 822.42 billion in October to R\$ 856.10 billion in November. In relation to November 2023 position (R\$ 908.86 billion), the liquidity reserve posted a 5.81% nominal decrease.

The Liquidity Index shows the sufficiency of the liquidity reserve to cover the Domestic Federal Public Debt (DFPD) payments. In order to measure this index, it is considered the maturities of principal and interest of securities held by the public, as well as the interest payments relative to the bonds in the Central Bank portfolio. The projection, at current value, considers only the issues already made and a specific scenario.

The current level guarantees the payment of the next 7.25 months of maturities.
